

Williams Electrical

williams-electric.co.uk

VERDICT: STRONG FOUNDATION

PREPARED FOR

Williams Electrical Ltd

PREPARED BY

Innov8 Workflows

DATE

13 June 2026

Executive Summary

Williams Electrical operates a genuinely well-engineered website. Across 28 crawled pages we found strong on-page fundamentals, comprehensive local-SEO architecture and rich structured data that already position the business to compete for electrician searches across Warwick and Warwickshire. The site earns a headline score of 7.6/10. The gap to a top-tier score is concentrated in three fixable areas: the complete absence of analytics/measurement, an over-weight homepage caused by image data embedded directly in the HTML, and a thin top-of-funnel content layer.

Category Scorecard

On-Page SEO Titles, meta, headings, alt text		9
Local SEO NAP, geo signals, area pages		9
Indexability & Crawl Sitemap, robots, canonicals		9
Technical SEO Mobile, HTTPS, markup hygiene		8.5
Structured Data Schema.org coverage & richness		8.5
Content & Topical Depth Breadth of service/area copy		7
Performance Page weight & Core Web Vitals		6
Analytics & Measurement Tracking, GSC, conversions		2

OVERALL SCORE 7.6 / 10

Weighted across the eight categories above. A strong, well-built site held back by measurement and performance gaps.

What's Working Well

Tailored metadata on every page

All 28 pages (home, 9 service pages, 12 location pages, plus about/contact/FAQ/work) carry unique, keyword-rich title tags and meta descriptions with location and unique-selling-point cues.

Comprehensive structured data

Electrician / LocalBusiness schema includes full NAP, geo-coordinates, opening hours, an areaServed list of 11 towns and an aggregateRating (5.0★, 33 reviews). FAQPage and BreadcrumbList markup is present on every service page.

Excellent local-SEO architecture

12 dedicated town landing pages (Warwick, Leamington Spa, Kenilworth, Coventry, Stratford-upon-Avon and more) combined with 9 service pages give strong geographic and topical coverage for “electrician in [town]” queries.

Clean on-page fundamentals

Exactly one H1 per page, a logical H2/H3 hierarchy, and 100% image alt-text coverage (23/23 on the homepage). Every URL declares a correct canonical tag.

Crawl & social readiness

Open Graph and Twitter Card tags, a 27-URL XML sitemap referenced from robots.txt, lang=“en-GB”, a web app manifest, a full favicon set and geo meta tags are all in place.

Mobile-first and secure

Responsive viewport, custom HTTPS domain, lazy-loaded imagery (17 images) and inlined critical CSS for fast first paint.

Issues & Recommendations

P1 No analytics or conversion tracking

No GA4, Google Tag Manager or call/form tracking was detected, and no Search Console verification is present. The business currently has no visibility into traffic, rankings or where leads come from.

Fix → Install GA4 via GTM, verify Google Search Console, and configure click-to-call and contact-form conversion events.

P1 Homepage HTML is 1.12 MB

Roughly 1.0 MB of that is seven images base64-embedded directly in the HTML. This blocks parsing, inflates Largest Contentful Paint and prevents the browser from caching those images.

Fix → Move embedded images to external, optimised WebP/AVIF files with explicit width/height; target sub-150 KB HTML.

P2 Location pages lack FAQ schema

Service pages carry FAQPage markup, but the 12 town landing pages do not — a missed local rich-result opportunity.

Fix → Add a short localised FAQ block plus FAQPage schema to each area page.

P2 Hero imagery heavier than needed

Hero and CTA JPEGs weigh 148–208 KB each, the main drag on Core Web Vitals.

Fix → Serve WebP/AVIF with responsive srcset; aim for sub-100 KB heroes to lift LCP.

P2 No individual review or sameAs markup

Schema declares an aggregateRating but no individual Review items and no sameAs links. Google increasingly wants reviewer context for star snippets, and sameAs strengthens entity trust.

Fix → Add Review items and a sameAs array linking the Google Business Profile and social profiles.

P3 No top-of-funnel content layer

Every page is transactional; there is no advice/blog content to capture informational searches such as “how much does an EICR cost” or “signs you need a rewire”.

Fix → Add a small advice hub to capture long-tail queries and strengthen internal linking.

Roadmap & Methodology

Suggested 90-day roadmap

- 
Weeks 1–2 · Measure
 Stand up GA4 + GTM, verify Search Console, submit the sitemap and configure call/form conversions so every later change can be measured.
- 
Weeks 3–5 · Performance
 Externalise the base64 images, convert heroes to WebP/AVIF with srcset and re-test Core Web Vitals. Biggest speed win for the least effort.
- 
Weeks 6–9 · Expand rich results
 Add FAQ + FAQPage schema to all 12 area pages and Review/sameAs markup site-wide to chase more local rich snippets.
- 
Weeks 10–12 · Content
 Launch a small advice hub (3–4 cornerstone articles) targeting informational queries and interlink it with the service and area pages.

Methodology

This audit was performed on 13 June 2026 against the production source of williams-electric.co.uk, covering 28 pages: the homepage, 9 service pages, 12 town landing pages and the about, contact, FAQ, work and legal pages. The live URL returned HTTP 403 to automated crawlers (bot protection), so signals were assessed from the deployed source rather than a live browser render.

Scores reflect crawlable on-page, technical, structured-data and local-SEO signals. Performance was estimated from HTML and asset weights; field Core Web Vitals were not measured in-browser and should be confirmed with PageSpeed Insights once analytics is in place. This document is an independent technical assessment, not a guarantee of specific rankings.
